Abstract

New 1-substituted 3,5-diaryl-2-pyrazolines **13-27** have been synthesized by the reaction of hydroxychalcones **1-12** and hydrazines in hot acetic acid solution. Structures of all new compounds have been elucidated by microanalyses, ¹H- and ¹³C-NMR spectroscopy.

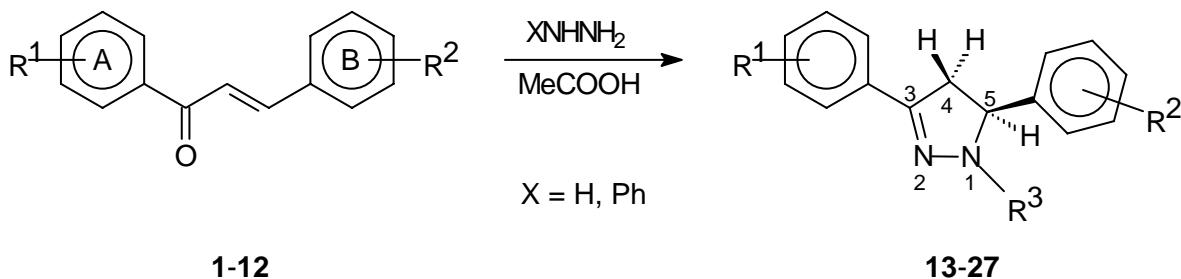

Keywords: Hydroxychalcones, hydrazines, 3,5-diaryl-2-pyrazolines

Introduction

Pyrazolines are prominent nitrogen-containing heterocyclic compounds and, therefore, various procedures have been worked out for their synthesis.¹⁻⁴ Numerous pyrazoline type compounds have been found to possess useful bioactivity, *e.g.* antimicrobial,⁵ central nervous system⁶ and immunosuppressive.⁷ Among the various pyrazoline isomers, 2-pyrazolines appear to be the most frequently investigated compounds. As a consequence, a large number of 2-pyrazolines have been described in the chemical literature, using different synthetic methods for their preparation. An especially popular procedure is based on the reaction of α,β -unsaturated aldehydes and ketones with hydrazines.⁸⁻³⁷ However, series of specially substituted representatives have been prepared rarely. For this reason, the aim of our present study was to synthesize systematically hydroxylated 3,5-diaryl-2-pyrazolines for the study of their structure-activity relationships.

Results and Discussion

Formation of 2-pyrazolines by the reaction of α,β -unsaturated ketones and hydrazines may take place under various reaction conditions using ethanol,¹⁸ acetic acid^{8-10,16,21,25-27} or pyridine^{28,29} as solvent. After some preliminary experiments, acetic acid was found to be a convenient solvent in our present case. Hydroxychalcones **1-12** were allowed to react with hydrazine hydrate or phenylhydrazine in hot acetic acid (*cf.* Experimental Section) to afford 1-substituted 3,5-diaryl-2-pyrazolines **13-27** in high yields (Scheme 1). *N*-Acetylation of all 2-pyrazolines obtained by the reaction of the appropriate chalcones with hydrazine has taken place under these reaction conditions in each case. Formation of the *N*-acetyl derivatives is beneficial since the 1-substituted 2-pyrazolines are stable compounds and can be used for biological and pharmaceutical trials without the risk of undesirable decomposition.

Structures of all new compounds **13-27** have been elucidated by elemental analyses, ¹H- and ¹³C-NMR measurements. In the ¹H-NMR spectra of 2-pyrazolines **13-27**, the three hydrogen atoms attached to the C-4 and C-5 carbon atoms of the heterocyclic ring gave an ABX spin system. Measured chemical shift and coupling constant values (*cf.* Experimental Section) unequivocally prove the 2-pyrazoline structure. In the ¹H-NMR spectra of 1-acetyl-2-pyrazolines **13-17, 21, 22** and **24-36** a singlet signal at around 2.4 ppm refers to the presence of an *N*-acetyl group. In the ¹³C-NMR spectra of all new 1-substituted 3,5-diaryl-2-pyrazolines **13-27**, the

chemical shift values of carbon atoms C-3 (154-156 ppm), C-4 (42-44 ppm) and C-5 (56-58 ppm) corroborate the 2-pyrazoline structure determined by ¹H-NMR spectroscopic measurements. ¹³C-NMR chemical shifts of the *N*-acetyl group also have been assigned in the case of compounds **13-17, 21, 22** and **24-26**.

In conclusion, we have synthesized systematically hydroxylated 3,5-diaryl-2-pyrazolines by the reaction of hydrazines and chalcones bearing an *ortho*-, *meta*- or *para*-hydroxy group in their ring A. These new substances allow the investigation of the possible linkage of the 2-pyrazolines to various sites in living organisms in the course of the investigation of their bioactivities. The new 1-substituted 3,5-diaryl-2-pyrazolines described in this paper are very stable compounds, a property which may render them especially useful substances in drug research.

Experimental Section

General Procedures. Melting points were determined with a Kofler hot-stage apparatus and are uncorrected. ¹H- and ¹³C-NMR spectra were recorded on a Varian Gemini 200 spectrometer at 200/50 MHz in CDCl₃ (internal standard TMS, δ = 0.0 ppm) at room temperature. Elemental analyses were measured in-house with a Carlo Erba 1106 EA instrument. TLC was performed on Kieselgel 60 F₂₅₄ (Merck) layer using hexane:acetone (7:3 v/v) or toluene:ethyl acetate (4:1 v/v) as eluents. Starting materials **1-12** were synthesized according to known procedures.³⁸⁻⁴¹

General procedure for the synthesis of compounds **13-27**

A mixture of hydroxychalcone (**1-12**, 10.0 mmoles), hydrazine hydrate (50.0 mmoles) or phenylhydrazine (50.0 mmoles) and acetic acid (40 ml) was refluxed for 3 hours then poured into water. The precipitate was separated by filtration, washed free of acid and crystallized from methanol to afford 2-pyrazolines **13-27** (Scheme 1).

5-(2,4-Dichlorophenyl)-3-(4-hydroxyphenyl)-1-phenyl-2-pyrazoline (27). This substance was prepared as yellow plates in 83% yield, m.p. 125-126 °C; ¹H-NMR (δ): 3.01 (1H, dd, J = 6.9, 17.2 Hz, 4-H_{trans}), 3.94 (1H, dd, J = 11.8, 17.2 Hz, 4-H_{cis}), 5.51 (1H, dd, J = 6.9, 11.8 Hz, 5-H),

6.75-7.62 (m, 12 arom. H), 10.30 (1H, s, OH); ^{13}C -NMR (δ): 41.9, 60.8, 113.2, 115.7, 119.4, 125.5, 127.7, 128.1, 128.6, 129.2, 129.8, 132.6, 134.0, 138.2, 144.8, 147.4, 156.6. Anal. Calcd. for $\text{C}_{21}\text{H}_{16}\text{Cl}_2\text{N}_2\text{O}$: C, 65.81; H, 4.21; N, 7.30. Found: C, 65.72; H, 4.17; N, 7.38.

Acknowledgements

The present study was sponsored by the Hungarian National Research Foundation (Grant No. OTKA T049468) for which our gratitude is expressed. Technical assistance of Mrs. M. Nagy is highly appreciated.
