Dedicated to the Professor Joan Bosch at occasion of his 60th birthday

#### Abstract

A procedure for the stereoselective synthesis of 2-deoxy-2-iodo-septanosides from pyranoses is reported. The procedure involves two reactions: Wittig-Horner olefination to give alkenyl sulfanyl derivatives, and electrophilic iodine-induced cyclization to give phenyl 2-deoxy-2-iodo-1-thio-septanosides (20) or 2-deoxy-2-iodo-septanosides (26a,b), in this case by subsequent hydrolysis of a phenylsulfanyl group under the reaction conditions. The seven membered ring of septanosides was only formed in moderate to low yields, preferably through a 7 -endo cyclization, when an isopropylidene group was present as protecting group. The use of benzyl groups as protecting moieties in the pyranose does not afford the septanoside ring. However, when the reactions conditions were forced using more basic media, the furanoside derivatives $\mathbf{3}$ were obtained.

Keywords: Oxepane, septanosides, 7-endo, electrophilic cyclization, 2-deoxy-carbohydrates

## Introduction

Septanosides are ring expanded analogues of pyranosides containing a seven membered ring. ${ }^{1}$ It has been previously demonstrated that septanoside derivatives bind concanavalin $A,{ }^{2}$ are glycosidase inhibitors, ${ }^{3}$ as well as their aza derivatives, ${ }^{4}$ and have been used to define new types of protein-carbohydrate interactions. ${ }^{5}$ Septanoses have been prepared by ring expansion of uloses, by Baeyer-Villiger oxidation of inositols and by Baeyer-Fischer reaction of sugar dialdehydes. ${ }^{1}$ Recently, 1,2-anhydro-septanose derivatives (glycals) have been synthesized using ring closing metathesis ${ }^{6}$ or by cyclization of alkynols induced by a tungsten catalyst. ${ }^{7}$ These 1,2-anhydro-septanose derivatives have been used to prepare new septanoside derivatives, ${ }^{8}$ and
disaccharides containing septanoses. ${ }^{9}$ Septanosides have also been prepared by acid-catalyzed cyclization of hydroxy-acetals. ${ }^{10}$

Recently we reported ${ }^{11}$ a procedure for the synthesis of phenyl 2-deoxy-2-iodo-1-thiopyranosyl glycosides ${ }^{12,13}$ from pentoses through a two step procedure consisting of WittigHorner olefination to give the sulfanylalkenes, and iodonium species-induced cyclization to give the 2-deoxy-2-iodo-1-thiopyranosyl glycosides (Scheme 1).

## Scheme 1

These 1-thio-pyranosides were useful glycosyl donors for the stereocontrolled synthesis of 2-deoxy-2-iodo-disaccharides. This procedure was particularly efficient for the synthesis of 2-deoxy- $\beta$-hexo-glycosides of allo or gulo configuration. ${ }^{11}$ 1-Thio-glycosides were also efficiently transformed to glycals ${ }^{14}$ (Scheme 1).

## Scheme 2

In order to expand the scope of this strategy, we decided to explore the olefination-electrophile-induced cyclization strategy as a route to 2 -deoxy-2-iodo-septanosides (Scheme 2). ${ }^{8 \mathrm{~b}}$ There are few examples for the formation of oxepane rings by electrophile-induced cyclization and these are mainly related to the formation of lactones through a 7 -exo cyclization mode. ${ }^{15}$ To the best of our knowledge, there is only one example of formation of oxepanes by iodine-induced cyclization of hydroxyl-enolethers through a 7 -endo cyclization. ${ }^{16}$ In this paper, we present our
results on the synthesis of heptenyl thioethers derived from protected hexo-pyranoses and pentoses and the study of electrophile induced cyclization under various conditions.

## Results and Discussion

As shown in previous studies, the Wittig-Horner conditions for the synthesis of sulfanyl-alkenes using phosphine oxide carbanions and Li bases were the most effective in terms of chemoselectivity, diastereoselectivity and yield. ${ }^{11}$ The selected olefination reagent diphenyl phenylsulfanylmethyl phosphineoxide was prepared by the Arbuzov reaction in $94 \%$ yield starting from ethyl diphenyl phosphinite and chloromethyl phenyl sulfide. ${ }^{17}$

When the Wittig-Horner reaction was carried out starting from 2,3,4,6-tetra-O-benzyl-Dglucopyranose 1 and diphenyl phenylsulfanyl methylphosphine oxide, the expected product 2 was obtained in $63 \%$ yield as an inseparable mixture of diastereomers ( $\mathrm{Z} / \mathrm{E}=1 / 8$ ), as expected for semi-stabilized carbanions.

## Scheme 3

3

## Scheme 4

Subsequently, the cyclization of the alkenylsulfanyl derivative 2 was studied. Initially, the standard conditions reported by Barlett, ${ }^{11,18}$ using iodine in acetronitrile in presence of $\mathrm{NaHCO}_{3}$, were tested. However, under these conditions only the starting material was recovered. Heating the mixture at $40^{\circ} \mathrm{C}$ or using NIS as an electrophile was also ineffective.

Increasing the nucleophilicity of oxygen forming first the alkoxide was also tested. Treatment of compound 2 with KH and iodine in ether at $-78^{\circ} \mathrm{C}$ did not provide the oxepane ring. However, reaction with $n$-Buli as a base afforded $\mathbf{3}$ in $62 \%$ yield (Scheme 4 ).

A similar behaviour had already been observed in the cyclization reaction of tri- $O$-benzylarabino derivative $\mathbf{4}$ in the presence of $\mathrm{KH},{ }^{19}$ which led to the formation of oxetane $\mathbf{5}$ in $31 \%$
yield (Scheme 5). However, in the presence of a weak base, the cyclization product 6 was preferentially formed. ${ }^{11 a}$

## Scheme 5

These unexpected outcome takes place when cyclization is attempted using BuLi or KH as bases. Under strong basic conditions, the more nucleophilic alkoxide anion 7 was expected to be formed and eventually cyclize. However, and as already studied previously, ${ }^{11 a}$ the preferred conformations in the arabino and gluco derivatives do not favour cyclization because the allylic alkoxide group does not occupy an inside position with respect to the $\mathrm{C}=\mathrm{C}$ double bond, so that alternative reaction pathways are likely to take place. One of them could consist of a proton transfer to render an allylic anion 8 that reprotonates to give enol ether $\mathbf{9}$, which is considerable electron richer and hence more reactive towards cyclization than the starting enol thioether 7 (Scheme 6).

## Scheme 6

Recently, the 7 -membered ring glycal $\mathbf{1 2}$ was synthesized by a tungsten-induced cyclization starting from alkyne $\mathbf{1 1}$ (Scheme 7). ${ }^{7}$ The presence of an isopropylidene protecting group was necessary in order to favor the formation of the seven-membered ring.

## Scheme 7

In order to test how the presence of a dioxolane cycle in the starting material would favor the cyclization reaction, we prepared the sulfanyl alkene 14 by reaction of the ribose derivative 13 with $\mathrm{Ph}_{2} \mathrm{P}(\mathrm{O}) \mathrm{CH}_{2} \mathrm{SPh}$ in the presence of BuLi . Then, the reaction of 14 with benzyl bromide afforded 15, which was subsequently treated with TBAF to give $\mathbf{1 6}$ (Scheme 8). Compound $\mathbf{1 7}^{20}$ with hydroxyl groups at positions 5 and 6 was also prepared from 14 to study the competition between 6 -endo and 7 -endo cyclization.

a) BuLi, THF, 68\%. b) $\mathrm{NaH}, \mathrm{BnBr}, \mathrm{THF}, 37 \%$. c) TBAF, THF, $96 \%$ for $\mathbf{1 6}, 98 \%$ for 17.

## Scheme 8

When 14 was treated with NIS in basic media at low temperature, compound 19 was isolated in $46 \%$ yield, as a result of 6 -endo cyclization to give $\mathbf{1 8}$ and concomitant loss of the silyl protecting group (Scheme 9). The stereochemical outcome of the reaction was similar to that previously observed for related compounds without isopropylidene protecting groups. ${ }^{11}$ Compound 19 was also exclusively obtained in similar yield starting from 17, which indicates that the 6 -endo cyclization is preferred over the 7 -endo.

When 16 was used as starting material, the reaction evolved much slower and required heating for a long period. After 24 hours at $35^{\circ} \mathrm{C}$, compound 20 was isolated in $12 \%$ yield (Scheme 9). The reaction was not complete and $40 \%$ of starting material was also recovered. The structure of $\mathbf{2 0}$ was determined according the following data: a) The signals of H 1 and C 1 which appear at chemical shifts, 5.56 ppm and 93.0 ppm respectively, characteristic of anomeric proton and carbon, and a $\mathrm{J}_{6 \mathrm{aa}, 6 \mathrm{~b}}$ value of 13 Hz , indicate that cyclization has taken place. b) The
presence of iodine at position 2 was confirmed by the correlation of H 2 with a ${ }^{13} \mathrm{C}$ signal at 32 ppm (Table 1). c) From $\mathrm{J}_{1,2}$ and $\mathrm{J}_{2,3}$ values, an equatorial disposition for the substituents at these positions can be deduced. d) The presence of H 2 on the botton face of the molecule was confirmed by the existence of NOE with the signal at 3.81 ppm that corresponds to H 6 axial.

It should be noted that the relative stereochemistry of iodine and the neighboring alkoxy group is trans, opposite to those observed for the cyclizations yielding pyranoses (Scheme 9), where the relative stereochemistry was always cis, as a result that cyclization takes place under the effect of the so-called alkoxy-inside effect. ${ }^{21}$ This effect establishes that in the more reactive conformer, the alkoxy chain occupies an inside conformation with respect to the double bond. The low reactivity observed can be due to the high substitution of the chain which limits the number of reactive conformations, and to the fact that cyclization in compound $\mathbf{1 6}$ takes place via the less reactive alkoxy-outside conformer.

## Scheme 9

In previous work, we prepared compound 22 by olefination of the lyxo derivative 21 (Scheme 10). ${ }^{11}$ Iodine-induced cyclization of 22 gave the 2-deoxy-2-iodo-1-thio-pyranoside $\mathbf{2 5}$ (Scheme 11). ${ }^{11}$ We had previously observed that benzyl ethers reacted in electrophile-induced cyclizations. ${ }^{22}$ In order to avoid this possibility, compound 22 was protected as ethyl ether to give derivative 23, which was treated with TBAF to afford 24 (Scheme 10). When 24 was treated with $\mathrm{NIS} / \mathrm{NaCO}_{3} \mathrm{H}$, the reaction slowly evolved to give a mixture of compounds 26a and 26b in $36 \%$ yield ( $32 \%$ of the starting material was also recovered) as an anomeric $\alpha / \beta$ mixture, resulting from a 7 -endo cyclization followed by the hydrolysis of the anomeric phenylsulfanyl group (Scheme 12). This hydrolysis was already observed in other cases when the cyclization was slow, since the activation of the 1-thiophenyl group by NIS competes. ${ }^{11}$ More relevant spectroscopic features allowing the structural elucidation of 26a,b are the following: a) ${ }^{13} \mathrm{C}$
chemical shifts at 96.9 and 98.1 ppm for C 1 and at 35.4 and 32.5 for C 2 , for 26a and 26b respectively, together with the absence of aromatic carbons, confirms the presence of an hydroxyl group at C 1 and an iodine at C 2 (Table 1). b) The existence of acetalic carbons and the $\mathrm{J}_{6 \mathrm{a}, 6 \mathrm{~b}}$ value of 13 Hz confirms that compounds are cyclized. c) For compound 26a, the $\mathrm{J}_{2,3}$ value of 10.0 Hz indicates that these protons are in a trans-diaxial position, and the NOE cross peak observed between protons H 2 and H 5 , confirms that iodine is on the $\alpha$-face. That suggests that for compound 26a the 7-endo cyclization has taken place under an alkoxy-outside control. Configuration of $\mathbf{2 6 b}$ could not be fully determined.

## Conclusions

Septanosides 20 and 26 were obtained in low to moderate yields from pentoses through a twostep procedure. A Wittig-Horner olefination of pentoses $\mathbf{1 3}$ and 21 gave the phenylsulphanyl derivatives 14 and 22, further protection and deprotection gave compounds 16 and 24, and NISinduced 7-endo cyclization afforded compounds 20 and 26. 7-Endo cyclization took place, preferably under alkoxy-outside control, when an isopropylidene protecting group was present in the starting alkene. This was the first example of 7-endo iodine-induced-cyclization to give highly substituted oxepanes. In the absence of an isopropylidene group the cyclization did not take place and when more basic reaction conditions were used, in order to force the cyclization, the reaction evolved in a different way to yield compound $\mathbf{3}$.

## Experimental Section

General Procedures. Optical rotations were measured at room temperature in 10 cm cells in a Perkin-Elmer 241 polarimeter. ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$ and ${ }^{31} \mathrm{P}$ NMR spectra were recorded using a Varian Gemini 300 MHz and 400 MHz apparatus, with $\mathrm{CDCl}_{3}$ as solvent, $\mathrm{Me} \mathrm{C}_{4} \mathrm{Si}$ as an internal reference, and $\mathrm{H}_{3} \mathrm{PO}_{4}\left({ }^{31} \mathrm{P}\right)$ as external standard, unless specified otherwise. Elemental analyses were performed using a Carlo-Erba Microanalyzer. Flash column chromatography was performed using silica gel 60 A CC (230-400 mesh). Radial chromatography was performed on 1,2 or 4 mm plates of Kieselgel $60 \mathrm{PF}_{254}$ silica gel, depending on the amount of product. Medium-pressure chromatography (MPLC) was performed using silica gel 60 A CC (6-35 $\mu \mathrm{m}$ ). Solvents were purified using standard procedures.

Diphenyl phenylsulfanyl methylphosphine oxide ( $1.3 \mathrm{~g}, 4.0 \mathrm{mmol}$ ) was dissolved in anhydrous THF ( $27 \mathrm{ml}, 0.15 \mathrm{M}$ ). $n-\mathrm{BuLi}\left(2.6 \mathrm{ml}, 4.2 \mathrm{mmol}, 1.6 \mathrm{M}\right.$ in hexane) was slowly added at $-78^{\circ} \mathrm{C}$, stirred under an argon atmosphere until the intensive orange colour was formed. The reaction mixture was stirred for an hour at this temperature, and the THF solution of the 2,3,4,6-tetra- $O$ -benzyl-D-glucopyranose ( $2.0 \mathrm{ml}, 0.5 \mathrm{M}$ ) was added. The evolution of the reaction was monitored by TLC analysis with general sugar dye. The reaction did not evolve at $-78^{\circ} \mathrm{C}$ and the solution was warmed up to room temperature. After full conversion ( 24 h ) and work up, the product was purified by flash chromatography (hexane:ethyl acetate $=3: 1$ ) to obtain the vinyl phenylsulfanyl compound ( $406 \mathrm{mg}, 0.6278 \mathrm{mmol}, 63 \%$ ) as an inseparable mixture of $Z / E=1 / 8$ as an oil.
NMR spectral data were extracted from the diastereoisomeric mixture. $\boldsymbol{E}-\mathbf{2}: \mathrm{R}_{\mathrm{f}}$ (hexane:ethyl acetate $=2: 1): 0.7 .{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta$ in ppm: 7.52-7.16 $(25 \mathrm{H}, m, \mathrm{Ar}), 6.30(1 \mathrm{H}, d, \mathrm{~J}=$ $15.2 \mathrm{~Hz}, \mathrm{H}-1), 5.70(1 \mathrm{H}, d d, \mathrm{~J}=15.2,8.0 \mathrm{~Hz}, \mathrm{H}-2), 4.80\left(1 \mathrm{H}, d, \mathrm{~J}=11.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.71(1 \mathrm{H}$, $\left.d, \mathrm{~J}=11.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.67\left(1 \mathrm{H}, d, \mathrm{~J}=11.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.62\left(1 \mathrm{H}, d, \mathrm{~J}=11.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, $4.64\left(\mathrm{H} 1, \mathrm{~J}=11.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.50\left(2 \mathrm{H}, s, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.48\left(1 \mathrm{H}, d, \mathrm{~J}=11.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.24(1 \mathrm{H}$, $d d, \mathrm{~J}=8.0,5.6 \mathrm{~Hz}, \mathrm{H}-3), 4.01(1 \mathrm{H}, m, \mathrm{H}-5), 3.72(2 \mathrm{H}, m, \mathrm{H}-6), 3.60(1 \mathrm{H}, s, \mathrm{H}-7 \mathrm{a}), 3.58(1 \mathrm{H}, d, \mathrm{~J}$ $=2.0 \mathrm{~Hz}, \mathrm{H}-7 \mathrm{~b}), 2.82(1 \mathrm{H}, d, \mathrm{~J}=6.0 \mathrm{~Hz}, \mathrm{OH}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right) \delta$ in ppm: 138.5, 138.3, 138.2, 138.1, 134.4 (C, Ar), 130.6-127.4 (CH, Ar), 128.6 (CH, C-1), 128.4 (CH, C-2), $81.6(\mathrm{CH}, \mathrm{C}-4), 81.0(\mathrm{CH}, \mathrm{C}-3), 78.6(\mathrm{CH}, \mathrm{C}-6), 75.0,73.5,73.34\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 71.2\left(\mathrm{CH}_{2}, \mathrm{C}-7\right)$, $71.0\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 70.5(\mathrm{CH}, \mathrm{C}-5)$.

( $\boldsymbol{Z} / \boldsymbol{E}$ )-6-O-tert-Butyldimethylsilyl-5- $\boldsymbol{O}$-benzyl-1,2-dideoxy-3,4- $\boldsymbol{O}$-isopropylidene-1-phenylsulfanyl-D-lyxo-hex-1-enitol (23). To a suspension of sodium hydride ( $16 \mathrm{mg}, 0.66$ mmol ) in THF, compound $22(244 \mathrm{mg}, 0.60 \mathrm{mmol})$ dissolved in freshly distilled THF ( 2.4 ml , $0.25 \mathrm{M})$ was added at room temperature. The reaction mixture was further stirred for an hour at room temperature and subsequently freshly distilled ethyl bromide ( $67 \mu \mathrm{l}, 0.9 \mathrm{mmol}$ ) was slowly added. The reaction mixture was stirred overnight, and the evolution of the reaction was followed by TLC. The reaction was then quenched with a saturated ammonium chloride solution. The aqueous layer was extracted with ethyl acetate ( $3 \times 20 \mathrm{ml}$ ), the combined organic layers were washed with water ( $2 \times 20 \mathrm{ml}$ ), with brine ( $1 \times 20 \mathrm{ml}$ ), dried on $\mathrm{MgSO}_{4}$, filtered and concentrated under vacuum. The mixture was purified by chromatography (hexane $\rightarrow$ hexane:ethyl acetate $=$ 1:1) and compound 23 was obtained as a light yellow oil ( $361 \mathrm{mg}, 0.74 \mathrm{mmol}, 37 \%$ ), as an inseparable mixture of $Z / E=1 / 4$.
NMR spectral data were extracted from the diastereoisomeric mixture. $\boldsymbol{E}-\mathbf{2 3}: \mathrm{R}_{\mathrm{f}}$ (hexane:ethyl acetate $=8: 1): 0.56 .{ }^{1} \mathrm{H}-\mathrm{NMR}^{23}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta$ in ppm: 7.50-7.20 $(5 \mathrm{H}, m, \mathrm{Ar}), 6.45(1 \mathrm{H}, d, \mathrm{~J}$ $=15.2 \mathrm{~Hz}, \mathrm{H}-1), 5.90(1 \mathrm{H}, d d, \mathrm{~J}=15.2,7.8 \mathrm{~Hz}, \mathrm{H}-2), 4.63(1 \mathrm{H}, d d, \mathrm{~J}=7.8,6.8 \mathrm{~Hz}, \mathrm{H}-3), 4.28$ $(1 \mathrm{H}, d d, \mathrm{~J}=6.8,4.0 \mathrm{~Hz}, \mathrm{H}-4), 3.74-3.64\left(3 \mathrm{H}, m, \mathrm{H}-6 \mathrm{a}, \mathrm{CH}_{2}(\mathrm{Et})\right), 3.43(1 \mathrm{H}, d d, \mathrm{~J}=9.2,7.2 \mathrm{~Hz}$, $\mathrm{H}-6 \mathrm{~b}), 3.26(1 \mathrm{H}, m, \mathrm{H}-5), 1.46\left(3 \mathrm{H}, s, \mathrm{CH}_{3}\right), 1.35\left(3 \mathrm{H}, s, \mathrm{CH}_{3}\right), 1.21-1.14\left(3 \mathrm{H}, m, \mathrm{CH}_{3}\right), 0.92$ $\left(9 \mathrm{H}, s, \mathrm{CH}_{3}\right), 0.12\left(6 \mathrm{H}, s, \mathrm{CH}_{3}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100.6 \mathrm{MHz}\right) \delta$ in ppm: $134.5(\mathrm{C}, \mathrm{Ar}), 130.2-$ $127.0(\mathrm{CH}, \mathrm{Ar}), 126.9(\mathrm{CH}, \mathrm{C}-1), 126.6(\mathrm{CH}, \mathrm{C}-2), 109.1(\mathrm{C}), 78.4(\mathrm{CH}, \mathrm{C}-5), 77.6(\mathrm{CH}, \mathrm{C}-3)$, $76.8(\mathrm{CH}, \mathrm{C}-4), 66.7\left(\mathrm{CH}_{2}\right), 62.6\left(\mathrm{CH}_{2}, \mathrm{C}-6\right), 29.8\left(\mathrm{CH}_{3}\right), 27.4\left(\mathrm{CH}_{3}\right), 26.0\left(\mathrm{CH}_{3}\right), 25.2\left(\mathrm{CH}_{3}\right) . \boldsymbol{Z}$ 23: $\mathrm{R}_{\mathrm{f}}$ (hexane/AcOEt=8/1): 0.55. ${ }^{1} \mathrm{H}-\mathrm{NMR}^{23}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta$ in ppm: 7.50-7.20 $(5 \mathrm{H}, m$, Ar), $6.48(1 \mathrm{H}, d, \mathrm{~J}=7.8 \mathrm{~Hz}, \mathrm{H}-1), 6.04(1 \mathrm{H}, d d, \mathrm{~J}=7.8,7.2 \mathrm{~Hz}, \mathrm{H}-2), 5.17(1 \mathrm{H}, d d, \mathrm{~J}=7.2,7.2$
