# Stereoselective synthesis of ophiocerin B 

Bhasker Akkala and Krishna Damera*

Discovery Laboratory, Organic Chemistry Division-III, Indian Institute of Chemical Technology, Hyderabad 500 007, India<br>E-mail: Kdamera@gsu.edu

DOI: http://dx.doi.org/10.3998/ark.5550190.p007.986

#### Abstract

A stereoselective total synthesis of ophiocerin B is reported by asymmetric synthesis, starting from L-malic acid. Of the three stereogenic centers, the vic-diols C-3, C-4 were obtained by Sharpless asymmetric dihydroxylation.

Keywords: Stereoselective, asymmetric synthesis, Sharpless asymmetric dihydroxylation

## Introduction

The tetrahydropyran skeleton features in a variety of biologically active natural products such as polyether antibiotics, marine toxins and pheromones. ${ }^{1}$ The substituted tetrahydropyran moiety is a part structure of a wide variety of natural products with diversified biological functions. ${ }^{2,3}$ Ophiocerins A-D (1-4) are a class of natural products isolated from freshwater aquatic fungi by Reategui et al. ${ }^{4}$ from Ophioceras venezuelense ${ }^{5}$ (Magnaporthaceae). The structural analysis of ophiocerins A-D was arrived at by Gloer et al. from spectroscopic studies, while the absolute stereochemistry was assigned by CD spectrometry by the use of the excitation chirality method. ${ }^{6}$ These new tetrahydropyran derivatives appear to be the first isolated natural products from the above genus. ${ }^{4}$ Consequently, compounds $\mathbf{1 - 4}$ have attracted considerable synthetic attention from various laboratories, ${ }^{7-11}$ including our own. ${ }^{10}$ So far, two research groups have been reported the total synthesis of Ophiocerin B, the first total synthesis was published by Yadav group, ${ }^{9}$ using chiral epoxide as a starting material, in 2008 Lee and Kang reported total synthesis of Ophiocerin B by using $\alpha$-D-glucopyranoside. ${ }^{7}$ Herein, we report the total synthesis of $\mathbf{2}$ from L-malic acid.

Ophiocerin A 1

Ophiocerin B 2

Ophiocerin C 3

Ophiocerin D 4

Figure 1. Structures of Ophiocerin A-D 1-4.

## Results and Discussion

The retrosynthetic analysis is outlined in Scheme 1. Ester 5 was prepared from commercially available L-malic acid, and the target compound $\mathbf{2}$ was synthesized from ester 5.

Scheme1. Retrosynthetic route to the target molecule 2.

As illustrated in Scheme 2, the synthesis of ophiocerin B 2 started from the commercially available L-malic acid. Accordingly, the known compound $\mathbf{1 0}$ (Scheme 2) was initiated from commercially available diol 7, which was prepared from known ester $\mathbf{6}^{12}$ in two steps. Selective tosylation of 6 and subsequent reduction of the resulting tosylate with $\mathrm{LiAlH}_{4}$ afforded 1,3- diol $7^{13,14}$ in $82 \%$ yield. Reaction of 7 with benzoyl chloride and $\mathrm{Et}_{3} \mathrm{~N}$ gave benzoate $\mathbf{8}$ ( $81 \%$ ), which upon silylation with TBSCl and imidazole furnished 9 in $92 \%$ yield. Base hydrolysis of ester 9 with $\mathrm{K}_{2} \mathrm{CO}_{3}$ and MeOH gave $\mathbf{1 0}$ (87\%)

Scheme 2. Synthesis of compound 10.
Alcohol $\mathbf{1 0}{ }^{15,16}$ on oxidation under Swern conditions ${ }^{17}$ furnished aldehyde $\mathbf{1 1}$ in $84 \%$ yield, which was without further purification used for the next step. Wittig olefination of aldehyde 11 furnished the ester $\mathbf{1 2}$ in $75 \%$ yield. Compound $\mathbf{1 2}$ was subjected to Sharpless asymmetric dihydroxylation ${ }^{18}$ with ADmix- $\beta$ to afford the compound $\mathbf{1 3}$ as pale yellow syrup in $65 \%$ yield. The acetonide was prepared under standard conditions using 2,2-dimethoxypropane (2,2-DMP) and catalytic $p$-toluenesulfonic acid (PTSA) in dichloromethane for 30 min at $0^{\circ} \mathrm{C}$ to provide 5 in $85 \%$ yield.

Scheme 3. Synthesis of target compound 2.

The ester 5 was then treated with DIBAL-H at $0{ }^{\circ} \mathrm{C}$ to yield alcohol $\mathbf{1 4}$ in $86 \%$. Further, tosylation of the resulting alcohol $\mathbf{1 4}$ to afford compound 15 . Treatment of compound $\mathbf{1 5}$ with tetra- $n$-butylammonium fluoride in THF at room temperature resulted in desilylation and concomitant cyclization ${ }^{15}$ in one step to give the cyclized product 16 in $65 \%$ yield $[\alpha]_{D}=-11.8(c$ $0.4, \mathrm{CHCl}_{3}$ ). Tetra- $n$-butylammonium fluoride (TBAF) in the present study acted as a desilylating agent, as well as a base to promote a facile cyclization reaction (Scheme 3). Finally, compound $\mathbf{1 2}$ on treatment with $p$-toluenesulfonic acid in MeOH gave ophiocerin B $\mathbf{2}$ in $85 \%$ yield, $[\alpha]_{\mathrm{D}}=-32.3\left(c \quad 0.25, \mathrm{CHCl}_{3}\right)$, matching that of the natural product ${ }^{4}[\alpha]_{\mathrm{D}}=-34.0(c 0.25$, $\mathrm{CHCl}_{3}$ ).

## Conclusion

In conclusion, we have accomplished total synthesis of ophiocerin B via Sharpless asymmetric dihydroxylation and Tetra- $n$-butylammonium fluoride (TBAF) mediated one-pot desilylation/cyclization. Thus, this strategy is adaptable for the generation of a library of stereoisomers. The generality of the method shown has significant potential for further extension to other isomers and related compounds.

## Experimental Section

General. All reactions were carried out under argon or nitrogen in oven dried glassware using standard gas-light syringes, cannulas, and septa. Solvents and reagents were purified and dried by standard methods prior to use. IR spectra were recorded on Perkin-Elmer FT-IR 240-c spectrophotometer using KBr optics. ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on Gemini200 spectrometer ( 200 MHz ) and Bruker- 300 spectrometer ( 300 MHz ) in $\mathrm{CDCl}_{3}$ using TMS as internal standard. Mass spectra were recorded on Finnigan MAT 1020 mass spectrometer operating at 70 eV . Column chromatography was performed using E. Merck 60-120, mesh silica gel. Optical rotations were measured with JASCO DIP-370 Polarimeter at $25{ }^{\circ} \mathrm{C}$.
(5R,E)-Ethyl 5-(t-butyldimethylsilyloxy)2-hexenoate (12). To a solution of oxalyl chloride (3.1 $\mathrm{mL}, 26.47 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$, dry DMSO ( $3.7 \mathrm{~g}, 53.92 \mathrm{mmol}$ ) was added drop wise and stirred for 10 min . A solution of $\mathbf{1 0}(4.5 \mathrm{~g}, 22.05 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ was added and stirred for 3 h at $-78{ }^{\circ} \mathrm{C} . \mathrm{Et}_{3} \mathrm{~N}(6.0 \mathrm{~mL}, 43.6 \mathrm{mmol})$ added and diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(20 \mathrm{~mL})$. The reaction mixture was washed with water ( 20 mL ), brine $(20 \mathrm{~mL})$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and evaporated to furnish the corresponding aldehyde $11(3.7 \mathrm{~g}, 84 \%)$.
The aldehyde $\mathbf{1 1}(3.7 \mathrm{~g}, 18.31 \mathrm{mmol})$ was dissolved in benzene and added to a refluxing solution of (ethoxycarbonylmethylene)triphenylphosphorane ( $9.5 \mathrm{~g}, 27.4 \mathrm{mmol}$ ) in benzene. After 4 h , solvent was evaporated and residue purified by column chromatography (EtOAc:hexane, 1:4) to afford $12(3.7 \mathrm{~g}, 75 \%)$ as a pale yellow syrup. $[\alpha]_{\mathrm{D}}-16.2\left(c 0.6, \mathrm{CHCl}_{3}\right)$; IR: 2924, 2854, 1745, $1460,1376,1105 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta 0.04\left(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right), 0.88(\mathrm{~s}, 9 \mathrm{H}, 3 \times$ $\left.\mathrm{CH}_{3}\right), 1.16\left(\mathrm{~d}, 3 \mathrm{H}, J 6.0 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 1.29\left(\mathrm{t}, 3 \mathrm{H}, J 7.5 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 2.34-2.46\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 3.97-$ $3.85(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}), 4.21\left(\mathrm{q}, 2 \mathrm{H}, J 7.5 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 5.78(\mathrm{~d}, 1 \mathrm{H}, J 15.8 \mathrm{~Hz},-\mathrm{CH}), 6.89(\mathrm{dt}, 1 \mathrm{H}, J 7.5$, $15.8, \mathrm{~Hz},-\mathrm{CH}$ ), ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta-4.62,14.1,17.9,23.7,25.7,42.3,59.9,67.5$, $145.8,123.1,166.2$; HRMS: $m / z[\mathrm{M}+\mathrm{Na}]^{+}$calcd 295.1806 found 295.2913 for $\mathrm{C}_{14} \mathrm{H}_{28} \mathrm{O}_{3} \mathrm{SiNa}$.
$\mathbf{( 2 R , 3 R}, 5 R$ )-Ethyl 5-(t-butyldimethylsilyloxy)-2,3-dihydroxyhexanoate (13). A well stirred solution of AD-mix- $\beta(5.7 \mathrm{~g}, 7.35 \mathrm{mmol})$ in $t-\mathrm{BuOH} / \mathrm{H}_{2} \mathrm{O}(1: 1,30 \mathrm{~mL})$ was treated with methanesulfonamide ( $0.69 \mathrm{~g}, 735 \mathrm{mmol}$ ) at room temperature. After 30 min , the clear yellow solution was cooled to $0^{\circ} \mathrm{C}$ and a solution of ester $\mathbf{1 2}(2.0 \mathrm{~g}, 7.35 \mathrm{mmol})$ in $t$ - $\mathrm{BuOH}(5 \mathrm{~mL})$ was added. The reaction mixture was stirred vigorously at $0^{\circ} \mathrm{C}$ for 12 h and then quenched with solid $\mathrm{Na}_{2} \mathrm{SO}_{4}(5 \mathrm{~g})$. It was warmed to room temperature and stirred for an additional 1 h . The resultant reaction mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 100 \mathrm{~mL})$ and the combined extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, filtered and evaporated to give crude residue, which was purified by column chromatography ( $30: 70 \% \mathrm{EtOAc}$ :hexane) to afford $13(1.4 \mathrm{~g}, 65 \% \text { ) as pale yellow syrup. [ } \alpha]_{\mathrm{D}}$ $11.1\left(c=0.25, \mathrm{CHCl}_{3}\right)$; IR: $3426,3019,2916,2859,1760,1216,1017 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ NMR ( 200 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta 0.09\left(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right) 0.90\left(\mathrm{~s}, 9 \mathrm{H}, 3 \times \mathrm{CH}_{3}\right), 1.21\left(\mathrm{~d}, 3 \mathrm{H}, J 5.9 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 1.33(\mathrm{t}, 3 \mathrm{H}, J$ $7.4 \mathrm{~Hz}, \mathrm{CH}_{3}$ ), 1.56-1.63 (m, 2H, CH2 $), 2.80-3.10(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}), 4.12-3.92(\mathrm{~m}, 2 \mathrm{H}, 2 \times \mathrm{CH}), 4.36$ (q, $2 \mathrm{H}, J 7.4 \mathrm{~Hz}, \mathrm{CH}_{2}$ ); ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta-4.12,14.34,23.21,25.81,30.71,39.14$,
